Experiment No :07

Experiment Name: Implementation of FCFS Scheduling Algorithm.
Objectives:
  ➢   What is FCFS Scheduling Algorithm?
  ➢   How to implementation in C?

❖ **FCFS Scheduling Algorithm :**
    The First Come First Served (FCFS) Scheduling Algorithm is the simplest one. In this algorithm the set of ready processes is managed as FIFO (first-in-first-out) Queue. The processes are serviced by the CPU until completion in order of their entering in the FIFO queue.
    A process once allocated the CPU keeps it until releasing the CPU either by terminating or requesting I/O. For example, interrupted process is allowed to run after interrupt handling is done with.

Aim: To write the c program to implement scheduling algorithm for first come first serve scheduling (FCFS).

Description:
To calculate the average waiting time using the FCFS algorithm first the waiting time of the first process is kept zero and the waiting time of the second process is the burst time of the first process and the waiting time of the third process is the sum of the burst times of the first and the second process and so on. After calculating all the waiting times the average waiting time is calculated as the average of all the waiting times. FCFS mainly says first come first serve the algorithm which came first will be served first.

Algorithm:

Step 1: Start the process

Step 2: Accept the number of processes in the ready Queue

Step 3: For each process in the ready Q, assign the process name and the burst time.

Step 4: Set the waiting of the first process as _0'and its burst time as its turnaround time.

Step 5: for each process in the Ready Q calculate

   a) Waiting time (n) = waiting time (n-1) + Burst time (n-1)

   b) Turnaround time (n)= waiting time(n)+Burst time(n)

Step 6: Calculate

  a) Average waiting time = Total waiting Time / Number of process

  b) Average Turnaround time = Total Turnaround Time / Number of process

Step 7: Stop the process

Corresponding Code:

```c
#include<stdio.h>
int main()
{
   int n,i,j,burst_time[30],waiting_t[30],turnaround_t[30];
   float avg_waiting_t=0,avg_turnaround_t=0;
   printf("Enter the num of Process : ");
   scanf("%d",&n);
   for(i=0;i<n;i++)
   {
      printf("\nEnter the burst time for Process P %d = ",i);
      scanf("%d",&burst_time[i]);
   }
      printf("\nProcess \t burst time \t waiting time \t turnaround time \n");
   for(i=0;i<n;i++)
   {
      waiting_t[i]=0;
      turnaround_t[i]=0;
      for(j=0;j<i;j++)
      {
         waiting_t[i]=waiting_t[i]+burst_time[j];
      }
       turnaround_t[i] = waiting_t[i] + burst_time[i];
       avg_waiting_t = avg_waiting_t + waiting_t[i];
       avg_turnaround_t = avg_turnaround_t + turnaround_t[i];
      printf("\tP%d\t\t%d\t\t%d\t\t%d\n",i,burst_time[i],waiting_t[i],turnaround_t[i]);
   }

   avg_waiting_t=avg_waiting_t/n;
   avg_turnaround_t=avg_turnaround_t/n;
   printf("\nAverage waiting time %.2f\n",avg_waiting_t);
   printf("\nAverage turnaround time %.2f\n",avg_turnaround_t);
   return 0;
}
```

Output:

```
shakhera@shakhera-HP-Notebook-PC: ~/Desktop

File  Edit  View  Search  Terminal  Help
shakhera@shakhera-HP-Notebook-PC:~/Desktop$ gcc FCFS_Algo.c -o FCFS
shakhera@shakhera-HP-Notebook-PC:~/Desktop$ ./FCFS
Enter the num of Process : 4

Enter the burst time for Process P 0 = 7

Enter the burst time for Process P 1 = 5

Enter the burst time for Process P 2 = 2

Enter the burst time for Process P 3 = 9

Process            burst time      waiting time      turnaround time
     P0                7                0                  7
     P1                5                7                  12
     P2                2                12                 14
     P3                9                14                 23

Average waiting time 8.25

Average turnaround time 14.00
```

Discussion: This lab help to learn about FCFS scheduling algorithm. we have implemented this algorithm using c language. Using this algorithm we can find waiting and turnaround time.
